

# CIS 371 Web Application Programming

## TypeScript II

Lecturer: **Dr. Yong Zhuang**

# Recall

- JavaScript and TypeScript,
- Initial Setup For Node JS,
- Function vs. Method,
- Data Types,
- multiple types,
- == vs ===,
- Arrays,
  - for-in vs. for-of,
  - push() and .pop(),
  - creates a copy using slice(),
  - delete/replaces elements splice(),

# Objects

## Java Classes and Objects

```
// Java objects must be instantiated from a class
// In Sub.java
class Sub() {
    public String name;
    public int calorie;
}

// In AnotherFile.java
Sub my_order = new Sub();
my_order.name = "Spicy Turkey";
my_order.calorie = 182;

my_order.price = 3.17; // ERROR!
```

vs.

## TS Objects

```
// TypeScript (no class needed)
const my_order = {
    name: "Spicy Turkey",
    calorie: 182
}
```

Objects can be created without a class definition

# Objects in TypeScript

```
// Typeless objects
const in_a_month = {
  name: "September",
  days: 30
}

const employee_vacation = {
  name: "Bob", days: 11
}
```

```
// Typed objects
type Monthly = {
  name: string,
  days: number
}

const in_a_month: Monthly {
  name: "September",
  days: 30
}
```

```
type VacationDays = {
  name: string,
  days: number
}

const employee_vacation: VacationDays = {
  name: "Bob",
  days: 11
}
```

# Objects with Sub-Objects & Array property

```
type City = {  
  name: string,  
  population: number,  
  geopos: {  
    lat: number,  
    lon: number  
  },  
  univs: Array<string>  
}
```

```
const ours:City = {  
  name: "Grand Rapids",  
  population: 198400,  
  geopos: {  
    lat: 42.9633599,  
    lon: -85.6680863  
  },  
  univs: [  
    "Calvin", "Cornerstone",  
    "GVSU"  
  ]  
}
```

```
const theirs:City = {  
  name: "East Lansing",  
  population: 48729,  
  geopos: {  
    lat: 42.737652,  
    lon: -84.483788  
  },  
  univs: [  
    "MSU",  
  ]  
}
```

```
console.log(ours.name);  
for (let u of ours.univs) console.log(u);  
  
console.log(theirs.geopos.lat);
```

```
Grand Rapids  
Calvin  
Cornerstone  
GVSU  
42.737652
```

# for-in to enumerate object properties

```
const theirs:City = {  
  name: "East Lansing",  
  population: 48729,  
  geopos: {  
    lat: 42.737652,  
    lon: -84.483788  
  },  
  univs: [  
    "MSU",  
  ]  
}
```

```
for (let z in theirs) {  
  console.debug(z)  
}
```

name  
population  
geopos  
univs

```
for (let z in theirs) {  
  console.debug(z, theirs[z]);  
} ^-----^ ERROR
```

```
const eLan = theirs as any;  
for (let z in theirs) {  
  console.debug(z, "==>", eLan[z])  
}
```

name ==> East Lansing  
population ==> 48729  
geopos ==> {lat: 42..., lon: -84...}  
univs == > ["MSU"]

# Array of Objects

```
// In Atom.java
class Atom {
    public String name;
    public weight double;
}

// In AnotherFile.java
ArrayList<Atom> atoms = new ArrayList<>();
Atom a = new Atom("Carbon", 12);
atoms.add(a);
Atom b = new Atom("Oxygen", 16);
atoms.add(b);
atoms.add(new Atom("Natrium", 23);
```

```
// TypeScript (no class required)
const atoms = [];
atoms.push({ name: "Carbon", weight: 12});
atoms.push({ name: "Oxygen", weight: 16});
atoms.push({ name: "Natrium", weight: 23});
```

*TS: option 1*

```
// Or initialize the array
const atoms = [
    { name: "Carbon", weight: 12},
    { name: "Oxygen", weight: 16},
    { name: "Natrium", weight: 23}
];
```

*TS: option 2*

# Array of Typed Objects

```
// Declare a type  
type Atom = {  
  name: string,  
  weight: number  
}
```

```
const atoms = [];  
atoms.push({ name: "Carbon", weight: 12});  
atoms.push({ namme: "Fluor", weight: 12}); // OK  
atoms.push({ name: "Oxygen"}); // OK  
atoms.push({ name: "Natrium", weight: 23, isMetal: false}); // OK
```

Typeless array

```
const atoms:Array<Atom> = [];  
atoms.push({ name: "Carbon", weight: 12});  
atoms.push({ namme: "Fluor", weight: 12}); // ERROR: "namme" does not exist  
atoms.push({ name: "Oxygen"}); // ERROR: property "weight" is missing  
atoms.push({  
  name: "Natrium",  
  weight: 23,  
  isMetal: false}); // ERROR: "isMetal" does not exist
```

Typed array

# Spreading an Array

```
const primes = [13, 17, 29];  
const squares = [9, 25, 81, 144];
```

```
squares.push(primes);
```

```
squares is [9, 25, 81, 144, [13, 17, 19]];  
squares.length is 5
```

```
squares.push(...primes);
```

```
// Without spread  
for (let p of primes)  
  squares.push(p);
```

```
squares is [9, 25, 81, 144, 13, 17, 19];  
squares.length is 7
```

# Spreading an Object

```
const name = { first: "Bob", last: "Dylan"};  
const job = { position: "Web Developer", salary: 75000};
```

```
const one = {name, job};
```

```
{  
  name: {  
    first: "Bob",  
    last: "Dylan"  
  },  
  job: {  
    position: "Web Developer",  
    salary: 75000  
  }  
}
```

```
const two = {name, ... job}
```

```
{  
  name: {  
    first: "Bob",  
    last: "Dylan"  
  },  
  position: "Web Developer",  
  salary: 75000  
}
```

```
const three = {  
  ... name,  
  ... job  
}
```

```
{  
  first: "Bob",  
  last: "Dylan",  
  position: "Web Developer",  
  salary: 75000  
}
```

# Spread on Objects (with duplicate props)

If objects have duplicate properties...

# Spread on Objects (with duplicate props)

```
const prop1 = {name: "Carbon", abbrev: "Cb"}  
const prop2 = {weight: 12, abbrev: "C"}  
// without spread on prop1  
const element = {prop1, ... prop2};
```

```
{  
  prop1: {  
    name: "Carbon", abbrev: "Cb"  
  },  
  weight: 12, abbrev: "C"  
}
```

```
const prop1 = {name: "Carbon", abbrev: "Ca"}  
const prop2 = {weight: 12, abbrev: "C", name: "Clue"}  
// with spread  
const element = {...prop1, ...prop2, isMetal: false};  
const el2      = {...prop2, ...prop1, isMetal: false};
```

*With spread*

```
{  
  isMetal: false,  
  name: "Clue",  
  abbrev: "C",  
  weight: 12,  
}
```

```
{  
  isMetal: false,  
  name: "Carbon",  
  abbrev: "Ca",  
  weight: 12,  
}
```

**Later values overwrite previous values of the same key**

# Object spread: copy and modify

```
const bob = {  
  first: "Bob",  
  last: "Dylan",  
  position: "Web Developer",  
  salary: 75000  
}
```

```
const bob_now = {  
  ...bob,  
  workFromHome: true,  
  position: "Cloud Data Egr.",  
  salary: 78000  
}
```

```
{  
  first: "Bob",  
  last: "Dylan",  
  workFromHome: true,  
  position: "Cloud Data Egr.",  
  salary: 78000  
}
```

*bob\_now*

*This won't work (no copy created).*

```
const bob_now = bob;  
bob_now.position = "Cloud Data Egr.";  
bob_now.salary = 78000;
```

# Array Destructuring

```
const nums:number[] = [1,2,3,4,5];  
const [first,rest] = nums;
```

*Without spread*

```
// first is 1 (number)  
// rest is 2 (number)
```

```
const nums:number[] = [1,2,3,4,5];  
const [first, ...rest] = nums;
```

*With spread*

```
// first is 1 (number)  
// rest is [2,3,4,5] (number[])
```

```
function splitIt([f, ...r]: number[]): void {  
  console.log(f);  
  console.log(r);  
}
```

```
// 5 a number  
// [20, 31, 19] an ARRAY of numbers
```

```
splitIt([5, 20, 31, 19]);
```

*With spread on func args*

# Array Destructuring

```
const nums:number[] = [1,2,3,4,5];  
const [first, ...rest] = nums;
```

*With spread*

```
// first is 1 (number)  
// rest is [2,3,4,5] (number[])
```

```
const nums:number[] = [1,2,3,4,5];  
const [...rest, last] = nums;
```

*Syntax Error*

*The operator (...) can only be used to gather the remaining elements in an array. It must be the last element in the destructuring assignment.*

# Optional Chaining (?) operator

```
type City = {  
  name: string,  
  population: number,  
  geopos: {  
    lat: number,  
    lon: number  
  } | null,  
  univs: Array<string>  
}
```

```
let newCity: City = {  
  name: "East Lansing",  
  population: 48729,  
  geopos: null,  
  univs: [  
    "MSU",  
  ]  
}
```

```
if (newCity.geopos) {  
  const lat = newCity.geopos.lat  
  console.log(lat)  
}  
else {  
  console.log("No Geo Info")  
}
```

```
const lat = newCity.geopos.lat
```

null?

```
const lat = newCity.geopos? newCity.geopos.lat: "No geo info"  
console.log(lat)
```

*ternary operator*

# Optional Chaining (?) operator

```
type City = {  
  name: string,  
  population: number,  
  geopos: {  
    lat: number,  
    lon: number  
  } | null,  
  univs: Array<string>  
}
```

```
let newCity: City = {  
  name: "East Lansing",  
  population: 48729,  
  geopos: null,  
  univs: [  
    "MSU",  
  ]  
}
```

```
const lat = newCity.geopos.lat
```

null?

```
const lat = newCity.geopos?.lat
```

*Chaining*

undefined

# Optional Parameter

```
function Hello(name?: string) {  
  if (name) {  
    console.log(`Hello ${name}`);  
  } else {  
    console.log("Hello World!");  
  }  
}
```

```
Hello("Alice"); // Output: Hello Alice  
Hello();        // Output: Hello World!
```

# Function Optional Parameters/Arguments

```
// whoAmI can be called with 2, 3, or 4 args
const whoAmI = (name: string, age: number, occupation?: string, spouse?: string): void => {
    console.log("Work as", occupation);
    console.log("Spouse name:", spouse ?? "N/A")
}
```

whoAmI("Andy", 22);	// Work as undefined
	// Spouse name: N/A
whoAmI("Bob", 43, "banker");	// Work as banker
	// Spouse name: N/A
whoAmI("Chuck", 31, undefined, "Cindy");	// Work as undefined
	// Spouse name Cindy
whoAmI("Chuck", 31, null, "Cindy");	// Work as null
	// Spouse name Cindy

# Coalesce operator (??) & non-null assertion operator (!)

```
let aName: string | null;
```

```
const theName:string = aName? aName : "No name"  
console.log(theName)
```

*ternary operator*

if **aName** is **null**,  
**theName** will be **null**  
even it should not have  
that type.

```
const theName:string = aName
```

null?

```
if (aName){  
    const theName:string = aName  
    console.log(theName)  
}  
else{  
    console.log("No name")  
}
```

```
const theName:string = aName ?? "no name"
```

*Coalesce*

```
const theName:string = aName!
```

*non-null assertion*

# Logical OR (||) operator

```
const aString = '';
console.log(aString ?? 'Empty Value');

const aNumber = 0;
console.log(aNumber ?? 'Zero Value');

const aBool = false;
console.log(aBool ?? 'False Value');
```

0  
false

Empty Value  
Zero Value  
False Value

```
const aString = '';
console.log(aString || 'Empty Value');

const aNumber = 0;
console.log(aNumber || 'Zero Value');

const aBool = false;
console.log(aBool || 'False Value');
```

# Enum vs. Literal Types

```
enum CollegeYear {  
    Freshman,  
    Sophomore,  
    Junior,  
    Senior  
}
```

*Sort order (enum order): Freshman < Sophomore < Junior < Senior*

```
let yr: CollegeYear;  
yr = CollegeYear.Junior;  
console.debug(yr);  
console.debug(CollegeYear[yr]);
```

2

Junior

```
type CollegeLiteral =  
    "Freshman" |  
    "Sophomore" |  
    "Junior" |  
    "Senior";
```

*Sort order (alphabetical): "Freshman" < "Junior" < "Senior" < "Sophomore"*

```
let yr: CollegeLiteral;  
yr = "junior"; // Compile error  
yr = "Junior"  
console.debug(yr); // Output "Junior"
```

# Enum vs. Literal Types

```
function setSize(size: "small" | "medium" | "large") {  
  // ...  
}
```

```
setSize("");
```

- large
- medium
- small

```
type typeSize = "small" | "medium" | "large";  
function setSize1(size: typeSize) {  
  // ...  
}
```

```
setSize1("");
```

- large
- medium
- small

```
enum enumSize {  
  "small",  
  "medium",  
  "large",  
}  
function setSize2(size: enumSize) {  
  // ...  
}
```

```
setSize2(enumSize.);
```

- large
- medium
- small

# Literal Types: Narrowing

```
// TypeScript
let dayOfWeek: string;
dayOfWeek = "Monday";    // No error

let strictDOW: "Mon" | "Tue" | "Wed" | "Thu";
strictDOW = undefined; // Error
strictDOW = "Fri"; // Error

let dieValue: 1 | 2 | 3 | 4 | 5 | 6;
dieValue = undefined; // Error
dieValue = 0; // Error
```

- Use this for data with one a small number of valid values.
- Invalid values are detected at compile time (not at runtime)

# String Interpolation (backquotes)

```
`Some text here ${var} and here`  
`More text ${expression} also here`
```

```
const x = "Eleven";  
const arr = [3, 5, 13];  
  
// Java-like string concatenation  
let oldStore = (4 + arr[0]) + "-" + x;    // 7-Eleven  
  
// Use backquotes string interpolation  
let store = `${4 + arr[0]}-${x}`;        // 7-Eleven
```

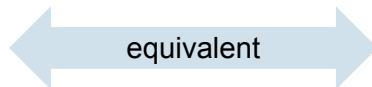

# ES6 key/value Shortcut

```
let cityName = "Allendale";  
let zipCode = "49401";  
  
let location = {  
  city: cityName,  
  zip: zipCode;  
};
```

```
let city = "Allendale";  
let zip = "49401";  
let location = {  
  city: city,  
  zip: zip;  
};
```

When both key and value refer to the same name, you don't have to write them both. Only one is required

```
let city = "Allendale";  
let zip = "49401";  
let location = {  
  city,  
  zip;  
};
```
